

## OHP Thrips Cocktail™

### 2015 Edition

**T**hrips, including flower and foliage thrips are difficult to control pests. Successful thrips management usually requires a combination of good cultural practices to minimize risk of colonization, good scouting and pest monitoring program to keep track of population changes and well timed insecticide applications. Remove old/unsold plants that may be hosts, control weeds inside and outside structures and consider screening vents and doors. A good pest monitoring program not only helps in deciding when to take action, but also what pesticide or pesticides to use. Insecticide applications are typically more effective when thrips numbers are low and before crop bloom. The goal of a thrips management program should be to prevent outbreaks but keeping numbers below damaging levels.
